1 PROJECT DETAILS

1.1 Summary Description of the Project

Enviro Rise is an initiative dedicated to the protection and restoration of diverse forest and peatland ecosystems in Seruyan, Central Kalimantan, Indonesia. With 62% of the area consisting of degraded peatlands, our mission is to shift from a “Business as Usual” (BAU) of Industrial Forest Plantation (HTI) business model that will clear the forest and drain the peatlands to one that actively restores and preserves these vital ecosystems. Key measures include canal blocking for rewetting, assisted/natural regeneration, fire prevention and management, community engagement, livelihood improvement programs, and biodiversity monitoring. These activities align with REDD+ and ARR methodologies under the Verified Carbon Standard (VCS).

The project focuses on conserving tropical peat swamp forests and restoring degraded peatland ecosystems in PT Rimbun Seruyan. The project is situated in Central Kalimantan, Indonesia, across two blocks of PT Rimbun Seruyan concession, encompassing 34,250 hectares in Seruyan and Kotawaringin Timur Regencies.

Prior to the project, the area faced deforestation and degradation driven by illegal oil palm expansion, canal development, and frequent fires. Over the past decade, 12,322 hectares were burned, with significant ecosystem disruption.

Our efforts aim to prevent the release of an estimated 1,316,941 ton CO₂eq/year emissions from HTI practice and other unplanned deforestation drivers by implementing comprehensive strategies. This includes emissions avoidance through REDD+ and Wetland Restoration and Conservation (WRC) activities 1,099,649ton CO₂e/year and removals via afforestation, reforestation, and revegetation (ARR) activities (217,291 tCO₂e/year). These include forest conservation reinforced by enhanced monitoring systems, a robust fire prevention plan, and the restoration of degraded peatlands through rewetting and revegetation. Additionally, we empower local communities by fostering sustainable livelihood opportunities, helping them build resilience and secure a brighter future.

1.2 Audit History

Audit type	Period	Program	Validation/verification body name	Number of years
Validation/verification	N/A	N/A	N/A	N/A

1.3 Sectoral Scope and Project Type

Sectoral scope	14: Agriculture, forestry, and other land use
AFOLU project category ¹	Reduced Emission from Deforestation and Degradation (REDD) Wetland Restoration and Conservation (WRC) Afforestation, Reforestation, and Revegetation (ARR)
Project activity type	Avoiding Planned Deforestation (APD) Avoiding Planned Wetland Degradation (APWD) Conservation of Intact Wetland (WRC) Rewetting of Degraded Wetlands (RWE) Afforestation, Reforestation, and Revegetation (ARR)

1.4 Project Eligibility

1.4.1 General eligibility

Enviro Rise is eligible under the VCS – CCB program as it fulfils the following criteria:

1. It confirms with all rules and requirements of the VCS Standard 4.7 as clearly explained throughout the project documentation.
2. The project activities are included under VCS Scope 14 as an Avoiding Planned Deforestation (APD), Avoiding Planned Wetland Degradation (APWD), Rewetting Drained Peatland (RPD) and Afforestation, Restoration, Revegetation (ARR) project. It applies the methodologies VM0007 v1.8 and VM0047 v1.1.
3. The project is initiating a pipeline listing process under VCS project timeline as set in the section 3.8.2 for AFOLU projects of VCS Standard 4.7, that is within three years of the project start date, and shall complete validation within five years of the project start date.
4. The project implementation does not lead to the violation of any applicable law.

¹ See Appendix 1 of the VCS Standard

5. The project has started the stakeholder engagement and Free, Prior and Informed Consent (FPIC). Enviro Rise considers this as an ongoing process and will ensure the process follows all requirements as listed in Section 3.18 of the VCS Standard 4.7.

1.4.2 AFOLU project eligibility

This AFOLU project combines two eligible VCS categories:

- Avoided Planned Deforestation (APD),
- Avoiding Planned Wetland Degradation (APWD)
- Rewetting Drained Peatland (RPD)
- Afforestation, Reforestation, and Revegetation (ARR)

The project is located in tropical peatland landscapes of Central Kalimantan, Indonesia, and aims to prevent legally permitted forest conversion to plantation forest while restoring degraded peat areas through native species reforestation and peat hydrology recovery through rewetting.

Avoided Planned Deforestation (APD):

APD involves preventing the legally permitted conversion of tropical peat swamp forest within the Enviro Rise project area in Central Kalimantan to industrial plantation. This is justified because:

- The land is legally designated and zoned for HTI (industrial forest plantation) by the Ministry of Forestry, as documented in two official permits:
 - a. IUPHHK-HTI/PMDN/2016 (1/1/2016) – Business License for Industrial Plantation Forest
 - b. SK.12747/MenLHK-PHL/PUPH/HPL.1/11/2023 – Rencana Kerja Usaha (RKU-General Workplan)Both documents are available and provide clear evidence that the deforestation was planned, legal, and financially viable.
- Under the business-as-usual (BAU) scenario, conversion to plantation would result in significant greenhouse gas (GHG) emissions from biomass loss, peat oxidation, and subsidence due to extensive drainage infrastructure development as approved under the Rencana Kerja Usaha (RKU).

Avoided Planned Wetland Degradation (APWD):

Peat degradation would occur from planned drainage infrastructure (e.g., canals, road development, infrastructure) necessary to support plantation establishment and harvesting, which the project aims to avoid.

Rewetting Drained Peatland (RDP):

In areas where drainage infrastructure was partially constructed prior to the project by public works and local communities for agriculture, the project implements rewetting interventions such as canal blocking to restore hydrology and reduce peat decomposition.

Afforestation, Reforestation, and Revegetation (ARR):

ARR activities are planned on degraded land cover classes, such as bareland and savanna, through assisted natural regeneration, and on shrub and forest land cover classes to support natural regeneration, enhancing carbon sequestration and restoring ecosystem functions.

The Enviro Rise project safeguards the integrity of native ecosystems and does not generate GHG credits from any conversion, clearing, draining, or degradation of native forest or peatland. Evidence includes:

- Remote sensing analysis using high resolution imaginaries confirms no clearing or drainage of intact peat swamp forest has occurred within the project boundary since the project start.
- Field verification and land use records confirm the protection of native ecosystems, with no activities that degrade or convert these ecosystems since project started.
- Project monitoring and enforcement mechanisms ensure ongoing protection against unauthorized forest clearing, fire or drainage.

For ARR areas within the project boundary, evidence demonstrates compliance with the VCS requirement that no clearing or conversion occurred within 10 years prior to the project start date:

- Historical land use maps and satellite imagery analysis confirm that ARR areas were classified as bareland, savanna, shrubland, or degraded forest and have remained non-forest for over 10 years prior to project initiation.
- Enviro Rise does not involve the conversion of any native forest or natural ecosystems. The ARR component is implemented only on areas where that clearing or conversion did not take place within 10 years of the project start.
- The project includes safeguards to protect biodiversity, hydrology, and peatland ecological functions. ARR species selection prioritizes native or site-adapted species appropriate for rewetted peatland conditions.
- Both VM0007 and VM0047 are approved for use under the current VCS Program and apply to the land types, activities, and conditions found in this project.

1.4.3 Transfer project eligibility

The project is not a part of any existing GHG program, nor is it intended to be part of other GHG programs.

1.5 Project Design

- ☒ Single location or installation
- ☐ Multiple locations or project activity instances (but not a grouped project)
- ☐ Grouped project

1.6 Project Proponent

Organization name	PT Rimbun Seruyan
Contact person	Arya Hanni
Title	President Director
Address	Grand ITC Permata Hijau 8th Fl, Unit A6, Kebayoran Lama, South Jakarta 12210
Telephone	+62 811 1219 381
Email	info@rimbunseruyan.com

1.7 Other Entities Involved in the Project

Organization name	Neusa Global Pte Ltd
Role in the project	Technical and operational support
Contact person	Bushh Pangestu
Title	Director
Address	160 Robinson Road, #14-04 Singapore Business Federation Center, Singapore
Telephone	+62 877 8497 9547
Email	bushh@neusa.net

1.8 Ownership

Enviro Rise complies with the ownership requirements of the VCS Standard v4.7 as set out by requirement 3.7.1²¹. It fulfils criteria 1 of 3.7.1 (“Project ownership arising or granted under statutory, regulation or decree by a competent authority”) and criteria 2 of 3.7.1 (“Project ownership arising by virtue of a statutory, property or contractual right in the land, vegetation or conservational or management process that generates GHG emission reductions and/or removals (where the project proponent has not been divested of such project ownership)”).

The project proponent possesses a list of legal approvals that they have obtained for the implementation of the project. A copy of each of the below documents is available upon request (Table below)

Decree No	Description	Approval given by	Date of issuance	Expiry Date
1/1/IUPHHK-HTI/PMDN/2016	Business License for Industrial Plantation Forest	Head of the Investment Coordinating Board	6 January 2016	5 January 2076
SK.752/Menlhk/Setjen/Hpl.3/9/2021	Nomenclature change for permit to Business License for Forest Utilization	Minister of Environment and Forestry	13 September 2021	5 January 2076

1.9 Project Start Date

Project start date	01-01-2024
Justification	The project start date corresponds to the date upon which PT Rimbun Seruyan entered into formal agreements to convert the project from the planned baseline of commercial conversion and drainage, to become a 100% protection and conservation project. These agreements were signed in late 2023, and were followed by the start of project activity around the turn of 2023-24. The project start date is conservatively defined as 01 January 2022 in order to align with calendar year accounting. This start date aligns with VCS standard 4.7 points 3.8.2 and 3.8.4 as the project will seek validation in 2025.

1.10 Project Crediting Period

Crediting period	☐ Seven years, twice renewable ☐ Ten years, fixed ☒ Other (state the selected crediting period and justify how it conforms with the VCS Program requirements)
	The project crediting period will be 40 years. The project crediting period started on 1 January 2024 and ends on the 31 December 2063. The beginning of the project crediting period coincides with the project start date.
Start and end date of first or fixed crediting period	01-01-2024 to 31-12-2063

1.11 Project Scale and Estimated GHG Emission Reductions or Removals

Indicate the estimated annual GHG emission reductions/removals (ERRs) of the project:

- ☐ < 300,000 tCO₂e/year (project)
☒ ≥ 300,000 tCO₂e/year (large project)

Complete the table below for the first (if renewable) or fixed crediting period:

Calendar year of crediting period	Estimated GHG emission reductions or removals (tCO ₂ e)
2023	833,199
2024	1,642,097
2025	2,358,842
2026	3,073,621
2027	3,426,471
2028	1,047,641
2029	244,855
2030	462,655
2031	870,092
2032	1,114,965

Calendar year of crediting period	Estimated GHG emission reductions or removals (tCO ₂ e)
2033	1,207,808
2034	1,299,346
2035	899,008
2036	1,078,213
2037	1,166,217
2038	1,253,159
2039	1,339,092
2040	1,424,066
2041	580,250
2042	1,507,155
2043	1,122,491
2044	1,354,744
2045	1,435,598
2046	1,515,747
2047	1,104,588
2048	1,273,515
2049	1,351,754
2050	1,429,419
2051	1,506,539
2052	1,583,140
2053	731,371
2054	897,096
2055	1,258,878
2056	1,484,312
2057	1,558,687
2058	1,632,681
2059	1,215,676

Calendar year of crediting period	Estimated GHG emission reductions or removals (tCO ₂ e)
2060	1,379,048
2061	1,452,010
2062	1,524,663
Total estimated ERRs during the first or fixed crediting period	53,640,709
Total number of years	40 years
Average annual ERRs	1,341,018

1.12 Description of the Project Activity

1. Deforestation and peat decomposition are prevented

Deforestation and peat decomposition are two key drivers of emissions in the without-project scenario. Rewetting the peatland areas and patrolling the project area regularly, in combination with community engagement and robust monitoring system will ensure that within the project area, the deforestation rate and peat decomposition rate are reduced.

Activities:

- Regular patrols will be conducted in the project area to detect and report illegal activities such as land grabbing, logging, or poaching.
- Increase community awareness of forest conservation: Village-level education programs will be organised to raise awareness about the impacts of illegal forest activities. This will be done in close collaboration with community teams to strengthen local involvement in conservation efforts.
- Blocking drainage canals : In the baseline scenario, the peatland areas designated for Acacia or NTFP production would be fully drained. In the project scenario, instead, peatland ecosystems are restored by blocking canals that drain the water, thereby helping to stabilize water levels and prevent peat degradation.
- Enrichment planting and silvicultural interventions : In the baseline scenario, the forest on areas designated for Acacia or NTFP production would be fully removed. In the project scenario, instead, forests are conserved and restored via enrichment planting and silvicultural measures such as liana cutting.

2. Emissions due to fire are prevented and reduced

Fire plays a large role in the emissions in the project area. Although rewetting the project area should reduce the fire risk, it remains important to prevent fires from taking place in the project area. This is done via a fire management system, fire patrols and capacity building for forest fire management.

Activities:

- a. Develop and implement an Integrated Fire Management (IFM) system and fire prevention plan . A comprehensive fire prevention and response system will be created to mitigate forest fires. This includes predictive fire mapping, early warning systems, and community-based fire management initiatives. This will be done together with the local communities and neighbouring companies.
- b. Establish forest fire patrols : Patrol teams will be formed to monitor forest areas for fire risks, conduct controlled burns where necessary, and respond rapidly to outbreaks of fire.
- c. Train staff and local communities in fire management . Provide training and resources to staff and local communities to improve skills in fire prevention, fire control, and post-fire recovery.

3. Degraded lands are regenerated

Large parts of the project area are degraded, having negative consequences for both the carbon stock in the area and the biodiversity. By identifying areas with high potential for reforestation, promoting the natural regeneration of forests and reforesting the most degraded areas, degraded land will be restored, carbon uptake will be enhanced, and biodiversity will be reinforced.

Activities:

- a. Promote natural regeneration : The existing forests will be protected and managed to encourage natural regeneration of vegetation, which supports biodiversity and enhances ecosystem services. This will be done through a combination of enrichment planting, liana cutting and other silvicultural measures.
- b. Forest rehabilitation via enrichment planting : The most degraded parts of the project area will be reforested via enrichment planting. Local communities will be engaged in the rehabilitation of forests through nursery planting and reforestation efforts.

4. RTE species are protected and habitat improved for biodiversity

The project area is a rare and vulnerable ecosystem which contains RTE species. As such, it is crucial that the project also aims at the protection and enhancement of these RTE species. Although this is partially done by the restoration of the project area as defined above, tracking the status of rare, threatened and endangered species, raising stakeholder awareness and protecting said species within the project area is also required.

Activities:

- a. Develop a database and monitoring plan for RTE species : A comprehensive database will be created to track the presence, population dynamics, and distribution patterns of Rare, Threatened, and Endangered (RTE) species.
- b. Establish a SMART patrol system for biodiversity monitoring and protection : Area, ecosystem, and species monitoring and protection will be conducted through the adoption of a Spatial Monitoring and Reporting Tool (SMART) Patrol System. This system enables the collection and digital storage of data in a centralized database, ensuring standardization, accountability, and transparency. It serves as a tool to monitor natural and human-induced threats, triggering alerts for species and overall biodiversity. The database generated will support protection plans and conservation actions.

- c. Develop a database of ecosystem diversity and taxonomy : As enrichment efforts are expected to increase biodiversity across various fauna taxonomies, a database will be created to track the change in biodiversity in the project area. Annual monitoring will be conducted through data collection in permanent sampling plots representing each ecosystem type within the area.
- d. Improvement and enrichment of critical habitats : A habitat-carrying capacity review will be conducted to analyse the availability of food sources within the project area. Enrichment activities will be implemented to enhance habitat quality, ensuring its primary function as a habitat for trigger species and RTE (Rare, Threatened, and Endangered) species.
- e. Combat invasive species: Measures will be implemented to monitor, prevent, and control the spread of invasive species that threaten native biodiversity. This will be done via removal programs, public awareness campaigns, and policy development.

5. Improving local community livelihood and capacity building for impacted groups

Activities:

- a. Support the communities in developing capacity and business models for sustainable alternative livelihoods. Enviro Rise aims to help the impacted communities to increase their access to funding and a downstream market to sell their goods.
- b. Develop alternative livelihood business models, have increased access to funding for those business models and have better access to the market to sell their products then community welfare is improved.
- c. Implement a capacity building program including organizational skills aiming at enhancing the knowledge, skills, attitudes and abilities towards sustainable fishing practices.

1.13 Project Location

Administratively, the project area located in the intersection of four villages: Sungai Bakau Village, Bangun Harja Village, Pematang Limau Village and Mekar Indah Village with the following geographical coordinates: 3° 4' 25.315" S, 112° 25' 55.860" E and 3° 20' 55.464" S, 112° 50' 2.724" E (Figure 1 – Location of the Project Area in the Central Kalimantan, Indonesia). The northern project area is bordered by oil palm plantation of PT Kelua Adi Raya, shrubland, production forests and protected forests. Whereas, in the southern project area is bordered by oil palm plantation (PT Seruyan Sawit Makmur. Shrubland and PT Gawi Bahandep Sawit Mekar in border the western project area. Finally, the eastern project area is bordered by settlement and agricultural areas.

The project zone refers to the area where AFOLU project activities aim to generate or maintain the net climate benefits, which includes the project area (REDD/WRC/ARR), areas eligible for crediting, leakage belt, leakage management area and any areas in which project activities are implemented.

Figure 1. Project location of Enviro Rise

1.14 Conditions Prior to Project Initiation

Enviro Rise will be implemented in areas mainly consists of peatlands. The vegetation is characterised by wet conditions in the project area and mainly consists of secondary swamp forest, swamp scrub and swamp bushes. The project is surrounded by five small communities. Historically, the project area has been utilized primarily for small-scale agriculture and timber extraction. In 2016, a industrial forestry license was issued by the Ministry of Environment and Forestry (KLHK) to PT Rimbun Seruyan, later upgraded to forest business utilization license in 2021, granting permission to develop a plantation on the site. Although the development of this plantation has been delayed, an updated Rencana Kerja Usaha (RKU) was issued in 2023, permitting the establishment of Acacia and Rubber plantations on 61.22%, or 24,572 hectares, which is 61.22% of the concession area of 40,135 ha. The remaining portion of the area is designated for the protection of deep peat ecosystems, riverbanks, shorelines, and wildlife protection zones. Prior to the issuance of the updated license, unauthorized drainage channels were constructed by third parties, including the local public works department (PUPR) . This unauthorized drainage has led to significant environmental degradation, including increased peat decomposition and a dryer environment susceptible to forest and peat fires. The unauthorized drainage channels also facilitated access to the area for illegal logging, agriculture and land grabbing. As such, the current area is partially drained and degraded. This is also reflected in the RKU, where a land cover analysis done in 2023 shows that 1,414 ha of the licence area is used for small-scale agriculture and another 787 ha for small-scale plantations. As this was all unauthorized by either the local authorities or the licence holder, it clearly shows the current scale of the land grab taking place.

1.15 Compliance with Laws, Statutes and Other Regulatory Frameworks

Enviro Rise is in compliance with all national, regional and local laws and regulations in Indonesia relevant to project activities. Key relevant national laws and regulations are listed in the sections below.

1.15.1 National Laws and Regional Planning

- Presidential Regulation No. 18/2020 concerning the National Medium-Term Development Plan 2020 – 2024.

1.15.2 Environment and Forestry Regulation

- Government Regulation No. 23/2021 concerning Forest Management Implementation.
- Government Regulation No. 21/2021 concerning Environmental Protection and Management Implementation.
- Ministry of Environment and Forestry No. 8/2021 concerning Forest Planning and the Development of Forest Management Plan as well as Forest Utilization in Forest Protection and Forest Production.

- Law No. 32/2009 concerning Environmental Protection and Management.
- Ministry of Forestry No. P.61/Menhut-II/2008 concerning the Ecosystem Restoration Requirement and Permit Issuance in Forest Production Area.

1.15.3 Forest Fire Prevention and Peat Management

- Presidential Instruction No. 3/2020 concerning the Forest and Land Fire Countermeasure.
- Ministry of Environment and Forestry Regulation No. P.10/Menlhk/Setjen/Kum.1/3/2019 concerning the Appointment, Enactment, and Management of Peat Dome Based on the Hydrological Peat Area.
- Ministry of Environment and Forestry Regulation No. P.60/Menlhk/Setjen/Kum.1/10/2019 concerning the Development, Enactment, and the Revision of the Peat Protection and Management Plan.
- Presidential Instruction No. 5/2019 concerning the Moratorium New Permitted Activities and the Improvement of Primary Natural Forest and Peatland Management.
- Ministry of Environment and Forestry No. P.8/Menlhk/Setjen/Kum.1/3/2018 concerning the Hotspot and/or Forest and Land Fire Verification Procedure.
- Ministry of Environment and Forestry No. P.14/Menlhk/Setjen/Kum.1/2/2017 concerning Inventory Procedure and Enactment of Peat Ecosystem Function.
- Ministry of Environment and Forestry No. P.15/Menlhk/Setjen/Kum.1/2/2017 concerning Water Level Measurement Procedure in Peat Ecosystem Point.
- Ministry of Environment and Forestry No. P.16/Menlhk/Setjen/Kum.1/2/201 concerning Technical Guidance on Peat Ecosystem Recovery.
- Ministry of Environment and Forestry No. P.32/Menlhk/Setjen/Kum.1/3/2016 concerning Forest and Land Fire Control.
- Government Regulation No. 57/2016 concerning the Amendments of Government Regulation No. 71/2014 concerning the Protection and Management of Peat Ecosystem.

1.15.4 Biodiversity

- Ministry of Environment and Forestry No. P.106/MENLHK/SETJEN/KUM.1/12/2018 concerning the Amendment of P.20/MENLHK/SETJEN/KUM.1/6/2018 regarding Protected Fauna and Flora.
- Ministry of Environment and Forestry No. P.94/Menlhk/Setjen/Kum.1/12/2016 concerning the Invasive Species.
- Government Regulation No 28/2011 concerning management of nature reserve areas (KSA) and conservation areas (KPA).
- Law No. 5/1990 concerning Biodiversity and Ecosystem Conservation.

1.15.5 Labor and Human Right

- Government Regulation No. 5/2021 concerning the Risk Based Permit.
- Law No. 11/2005 concerning the Ratification of International Covenant on Economic Social and Cultural Rights.
- Law No. 13/2003 concerning Manpower.

1.15.6 Carbon Pricing and Climate Change Regulation

- Ministry of Environment and Forestry Decree No. No. 1027/MENLHK/PHL/KUM.1/9/2023 concerning Forest Sector Carbon Trading Roadmap.
 - Ministry of Environment and Forestry Decree No. 716/MENLHK/SETJEN/KUM.1/6/2023 concerning the integration of carbon pricing mechanism.
 - Ministry of Environment and Forestry No. 7/2023 concerning Carbon Trading in Forestry Sector.
 - Ministry of Environment and Forestry No. 22/ 2021 concerning the Implementation of Carbon Pricing.
 - Ministry of Environment and Forestry Decree No. No. 168/Menlhk/PKTL/PLA.1/2/2022 Indonesia's Forestry and Other Land Use (FOLU) Net Sink 2030 for Climate Mitigation.
- Presidential Regulation No. 98/2021 concerning carbon pricing.
- Law No. 7/2021 Tax Harmonization.
- Government Regulation No. 46/2017 concerning the Green Environmental Instrument.
- Ministry of Environment and Forestry No. P.70/Menlhk/Setjen/Kum.1/12/2017 concerning the Implementation Procedure for Reducing Emissions from Deforestation and Forest Degradation, Role of Conservation, Sustainable Management of Forest, and Enhancement.
- Ministry of Environment and Forestry No. P.72/Menlhk/Setjen/Kum.1/12/2017 concerning the Implementation Guidance for Measurement, Reporting and Verification of Climate Action and Resources.
- Ministry of Environment and Forestry No. P.73/Menlhk/Setjen/Kum.1/12/2017 concerning the Implementation and Reporting Guidance for Greenhouse Gas Inventory.
- Ministry of Environment and Forestry No. P.71/Menlhk/Setjen/Kum.1/12/2017 concerning the Implementation of National Registry System for Climate Action.
- Law No. 16 / 2016 concerning on the Ratification of Paris Agreement.
- Ministry of Forestry No. P.12/Menhut-II/2014 concerning Types and Tariffs of Non-Tax State Revenue Applicable to the Ministry of Forestry.

1.16 Double Counting and Participation under Other GHG Programs

1.16.1 No Double Issuance

Is the project receiving or seeking credit for reductions and removals from a project activity under another GHG program?

☐ Yes ☒ No

1.16.2 Registration in Other GHG Programs

Has the project registered under any other GHG programs?

☐ Yes ☒ No

1.16.3 Projects Rejected by Other GHG Programs

Has the project been rejected by any other GHG programs?

☐ Yes ☒ No

1.17 Double Claiming, Other Forms of Credit, and Scope 3 Emissions

1.17.1 No Double Claiming with Emissions Trading Programs or Binding Emission Limits

Are project reductions and removals or project activities also included in an emissions trading program or binding emission limit? See the *VCS Program Definitions* for definitions of emissions trading program and binding emission limit.

☐ Yes ☒ No

1.17.2 No Double Claiming with Other Forms of Environmental Credit

Has the project activity sought, received, or is planning to receive credit from another GHG-related environmental credit system? See the *VCS Program Definitions* for definition of GHG-related environmental credit system.

☐ Yes ☒ No

1.17.3 Supply Chain (Scope 3) Emissions

Do the project activities specified in Section 1.12 affect the emissions footprint of any product(s) (goods or services) that are part of a supply chain?

☐ Yes ☒ No

If yes:

Is the project proponent(s) or authorized representative a buyer or seller of the product(s) (goods or services) that are part of a supply chain?

☐ Yes

☐ No

If yes:

Has the project proponent(s) or authorized representative posted a public statement on their website saying, "Carbon credits may be issued through Verified Carbon Standard project [project ID] for the greenhouse gas emission reductions or removals associated with [project proponent or authorized representative organization name(s)] [name of product(s) whose emissions footprint is changed by the project activities]."

☐ Yes

☐ No

1.18 Sustainable Development Contributions

Enviro Rise has a variety of activities that contribute to sustainable development (SD). These activities include forest conservation, reforestation, and capacity-building for local communities. The program aims to ensure successful environmental and natural resources management integrated with climate change, biodiversity preservation, and community livelihood improvement as part of a sustainable management framework.

Furthermore, the project aligns with Indonesia's national priorities, particularly supporting under the Paris Agreement, emphasizing reducing emissions from deforestation and forest degradation (REDD+), and Indonesia's Biodiversity Strategy and Action Plan (IBSAP) 2025 - 2045. Furthermore, it advances several of Indonesia's Sustainable Development Goals (SDGs), particularly those related to SDG 1 (No poverty), 3 (Ensure healthy lives and promote well-being for all at all ages), 4 (Education quality), 6 (clean water and sanitation), 8 (decent work and economic growth), 13 (Climate Action), and SDG 15 (Life on Land).

To ensure alignment with Indonesia's sustainable development priorities, the project will include provisions for regular monitoring and reporting. Environmental and socioeconomic assessments are carried out to monitor reforestation progress, carbon sequestration, and improvements in local livelihoods. Local communities in five villages will actively participate in participatory monitoring, with periodic reports submitted to national authorities such as the Ministry of Forestry. These reports will ensure that the project remains transparent, accountable, and aligned with Indonesia's sustainable development goals.

SDG Indicators ²	Relevant Provision	Project Contribution
SGD 1 No. Poverty		
1.4. ensure that all men and women, in particular the poor and the vulnerable, have equal rights to economic resources, as well as access to basic services, ownership and control over land and other forms of property, inheritance, natural resources, appropriate new technology and financial services, including microfinance	National SDG document Mitigation document 2015-2045	• Provide direct employment opportunities and additional income streams for local communities, especially in 5 villages. • Improving access to resources, providing economic opportunities, and fostering inclusivity, which helps reduce poverty and promotes equitable development.
1.5. build the resilience of the poor and those in vulnerable situations and reduce their exposure and vulnerability to climate-related extreme events and other economic, social and environmental shocks and disasters		• Strengthen local economies by providing alternative livelihoods and enhancing natural resource conservation, reducing the risks of poverty due to environmental degradation.
SDG 3. Ensure healthy lives and promote well-being for all at all ages		
3.8. Achieve universal health coverage, including financial risk protection, access to quality essential health-care services and access to safe, effective, quality and affordable essential medicines and vaccines for all	• National Health Insurance (JKN) • National Medium Term Development Plan (RPJMN) • Primary Health Care Service (Puskesmas)	• Improving public health through environmental protection • Reducing health risk due to climate change • Supporting healthier livelihoods especially in clean water source • Promoting health education and awareness • Reducing burden on health infrastructure -
3.9. substantially reduce the number of deaths and illnesses from hazardous chemicals and air, water and soil pollution and contamination	Laws on air and hazardous chemical and waste management (Law No. 32 of 2009 on Environmental Protection and Management (UUPPLH)), water (Law No. 17 of 2019 on Water Resources Management), and soil pollution (aw No. 41 of 2009 on Sustainable Agricultural Land Protection) and public health programs	• Reducing air pollution due to forest fires • Protecting water resources • Minimizing soil contamination • Reducing hazardous emission including smoke and forest fire

² The SDG indicators can be found at <https://ourworldindata.org/sdgs>

SDG 4. Education quality		
4.4. Substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship	National SDG regulation especially on education	• Provide hands-on training in areas such as forestry management, clean energy installation, clean water installation, and carbon monitoring, • Empowering communities with technical expertise. By creating local employment opportunities and fostering skill development, carbon projects help bridge the gap between education and meaningful work in sustainable industries.
SDG 6. Clean water and Sanitation		
6.1. Achieve universal and equitable access to safe and affordable drinking water for all		Safeguard watersheds, reduce soil erosion, and improve water quality for communities, ensuring a more reliable and safe water supply. Additionally, some carbon projects invest in clean water infrastructure, such as rainwater harvesting systems or clean water access technologies, directly benefiting vulnerable populations.
6.6. Protect and restore water-related ecosystems, including mountains, forests, wetlands, rivers, aquifers and lakes		Through activities like reforestation and sustainable land management, these projects help preserve biodiversity, enhance natural water filtration, and regulate water cycles, ensuring the health of vital water bodies. Additionally, carbon projects support the long-term resilience of water ecosystems, helping to mitigate the impacts of climate change, pollution, and overuse
SDG 8. Decent work and economic growth		
8.2. Achieve higher levels of economic productivity through diversification, technological upgrading and innovation, including through a focus on high-value added and labour-intensive sectors	• National SDG document and regulation • RPJMN 2025 - 2029	These projects help to enhance productivity by introducing innovative technologies and practices that improve resource efficiency and reduce environmental impacts. By fostering skills development and investing in local economies, carbon projects help drive economic diversification and resilience, boosting productivity

		while addressing climate challenges.
SDG 13. Climate Action		
13.1. Strengthen resilience and adaptive capacity to climate-related hazards and natural disasters	- National SDG document and regulation - National disaster mitigation document - ENDC (Enhanced Nationally Determined Contribution) document	Strengthen local resilience to climate impacts by enhancing ecosystems' capacity to absorb carbon, regulate water cycles, and protect against extreme weather events such as floods and droughts. Additionally, carbon projects often incorporate climate adaptation strategies, supporting vulnerable communities in building long-term resilience to the effects of climate change.
SDG 15. Life on Land		
15.1. ensure the conservation, restoration and sustainable use of terrestrial and inland freshwater ecosystems and their services, in particular forests, wetlands, mountains and drylands, in line with obligations under international agreements	- National SDG document and regulation - Aichi Biodiversity target - Biodiversity Strategy and Action Plan (IBSAP) 2015-2020 - National Strategy on Wetland: peatland and mangrove - IUCN Redlist	Through activities like afforestation, reforestation, and sustainable land management, these projects help protect ecosystems and enhance their ability to provide essential services like clean air and water. Additionally, carbon projects support the sustainable use of ecosystems, ensuring the preservation of biodiversity while improving the livelihoods of local communities dependent on these natural resources.
15.5. Take urgent and significant action to reduce the degradation of natural habitats, halt the loss of biodiversity and protect and prevent the extinction of threatened species	- CITES 2023 - National regulations referring to government regulation no 106/201; and conservation regulation no 32/2024	By reducing deforestation and promoting sustainable land use, these projects mitigate the destruction of ecosystems, preserving the natural habitats that support biodiversity. Additionally, carbon projects enhance ecosystem resilience to climate change, helping prevent species extinction and maintaining the ecological balance necessary for sustaining diverse plant and animal life.

1.19 Additional Information Relevant to the Project

1.19.1 Leakage Management

To be completed in the full PD.

1.19.2 Commercially Sensitive Information

To be completed in the full PD.

1.19.3 Further Information

To be completed in the full PD.

2 SAFEGUARDS AND STAKEHOLDER ENGAGEMENT

2.1 Stakeholder Engagement and Consultation

2.1.1 Stakeholder Identification

To be completed in the full PD.

2.1.2 Stakeholder Consultation and Ongoing Communication

To be completed in the full PD.

2.1.3 Free Prior and Informed Consent

To be completed in the full PD.

2.1.4 Grievance Redress Procedure

To be completed in the full PD.

2.1.5 Public Comments

To be completed in the full PD.

2.2 Risks to Stakeholders and the Environment

2.2.1 Management Experience

To be completed in the full PD.

2.2.2 Risk Assessment

To be completed in the full PD.

2.3 Respect for Human Rights and Equity

2.3.1 Labor and Work

To be completed in the full PD.

2.3.2 Human Rights

To be completed in the full PD.

2.3.3 Indigenous Peoples and Cultural Heritage

To be completed in the full PD.

2.3.4 Property Rights

To be completed in the full PD.

2.3.5 Benefit Sharing

To be completed in the full PD.

2.4 Ecosystem Health

To be completed in the full PD.

2.4.1 Rare, Threatened, and Endangered Species

To be completed in the full PD.

2.4.2 Introduction of Species

To be completed in the full PD.

2.4.3 Ecosystem Conversion

To be completed in the full PD.

3 APPLICATION OF METHODOLOGY

3.1 Title and Reference of Methodology

Enviro Rise applies the latest version of VCS Methodology VM0007 (version 1.8). Applicable modules are listed the table below.

Type (methodology, tool or module).	Reference ID, if applicable	Title	Version
Methodology	VM0007	VM0007 REDD+ Methodology Framework (REDD+MF),	6.0
Methodology	VM0047	Afforestation, Reforestation and Revegetation	10
Tool	VT0001	VT0001 Tool for Demonstration and Assessment of Additionality in VCS Agriculture, Forestry and Other Land Use (AFOLU) Project Activities (T- ADD)	30
Tool	NPRT	AFOLU Non-Permanence Risk Tool (T- BAR	42
Tool	T-SIG	Tool for testing significance of GHG emissions in A/R CDM Activities (T- SIG)	01
Module	VMD0001	Estimation of carbon stocks in the above- and below-ground biomass in live tree and non-tree pools (CP-AB)	11
Module	VMD0006	Estimation of baseline carbon stock changes and greenhouse gas emissions from planned deforestation/forest degradation and planned wetland degradation (BL-PL)	13
Module	VMD0009	Estimation of emissions from activity shifting for avoided unplanned deforestation and avoiding unplanned wetland degradation (LK- ASU)	12
Module	VMD0011	Estimation of emissions from market effects (LK-ME)	11
Module	VMD0012	Estimation of emissions from displacement of fuelwood extraction (LK- DFW)	10
Module	VMD0013	Estimation of greenhouse gas emissions from biomass and peat burning (E-BPB)	12
Module	VMD0014	Estimation of emissions from fossil fuel combustion (E-FC)	10
Module	VMD0015	Methods for monitoring of greenhouse gas emissions and removals (M-REDD)	22
Module	VMD0016	Methods for stratification of the project area (X-STR)	12

Module	VMD0017	Estimation of uncertainty for REDD project activities (X-UNC)	22
Module	VMD0042	Estimation of baseline soil carbon stock changes and greenhouse gas emissions in peatland rewetting and conservation project activities (BL- PEAT)	11
Module	VMD0044	Estimation of emissions from ecological leakage (LK-ECO)	11
Module	VMD0046	Methods for monitoring soil carbon stock changes and greenhouse gas emissions and removals in peatland rewetting and conservation project activities (M-PEAT)	11
Module	VMD0054	Module for Estimating Leakage from ARR Activities	10

3.2 Applicability of Methodology

VCS Methodology VM0007 and VM0047 provide the generic functionality of the methodologies, which frames predefined modules and tools that perform a specific function. It constitutes, together with the modules it calls upon, a complete REDD+ and ARR baseline and monitoring methodology. The modules and tools applicable to this project relate to:

- Project activities that reduce emissions from planned deforestation (APD);
- Project activities that reduce emissions from planned wetland degradation (APWD);
- Project activities that reduce emissions by rewetting drained peatland (RPD);
- Project activities that remove emissions by afforestation, restoration and revegetation (ARR)

To determine the type of VCS-eligible project activities, the applicability conditions of VM0007 and VM0047 were considered.

Applicability of the VM0007 & VM0047 methodologies and their associated modules

Methodology ID	Applicability condition	Justification of compliance
VM0007	- The area eligible for REDD+ has been forest for at least 10 years prior to the project start date. Furthermore, the project does not contain any mangrove forest. - The project is partly located on peatlands. As the emissions from the SOC pool are deemed significant, the relevant WRC modules are applied.	Condition met.

	- The baseline deforestation in the project is classified as planned deforestation per the selected baseline scenario - The project does not plan to either flood agricultural lands to increase production or intensify livestock production through the use of feed-lots and/or manure lagoons. - Conversion of forest lands to deforested lands is legally permitted.	
VM0047	- Project activities do not intend to lower the water table, instead, the project activities should result in raising the water table - The changes in hydrology should result in the accumulation or at minimum maintenance of the SOC stock as a result of additional sedimentation and/or vegetation development (- Any improved hydrological connectivity should not result in significant increases in GHG emissions outside of the project area - Project activities do not include the burning of organic soil - No nitrogen fertilizers are applied in the project area during the project crediting period. - Prior to the project start date, PT RS already held the legal rights exploit the RS concession, as permitted by Indonesian law. Parts of the concession are protected from conversion under the same RKU Indonesian law. For these areas, 6.a.III holds: No land use has been identified that will be shifted because of the project. Any further degradation of these areas would be prohibited by law. These areas are eligible for RWE crediting	Condition met.

	- The area eligible for RDP activities meets the VCS definition for peatland - The area eligible for CIW activities meets the VCS definition for peatland - PT RS holds the legal rights to convert the intact or partially altered wetlands to a degraded condition, as permitted by Indonesian law	
VT0001	The tool is applicable under the following conditions. Forestation of the land within the proposed project boundary performed with or without being registered as the A/R CDM project activity shall not lead to a violation of any applicable law even if the law is enforced. The tool is not applicable to small-scale afforestation and reforestation activities	Condition met.
NPRT	This tool provides the procedures for conducting the non- permanence risk analysis and buffer determination required for AFOLU projects. AFOLU projects shall comply with all the requirements set out in the document.	Condition met.
VMD0001	This module is applicable to all forest types and age classes.	Condition met.
VMD0002	This module is applicable to all forest types and age classes	Condition met.
VMD0003	This module is applicable to all forest types and age classes.	Not applicable The litter pool has been conservatively omitted.
VMD0004	This module is applicable to non-organic soils under all forest types and age classes	Not applicable The SOC pool on non-organic pools has been conservatively omitted.
VMD0005	This module is applicable to all cases where wood is harvested for conversion to wood products for	Not applicable

	commercial markets, for all forest types and age classes.	The long-term wood products pool has been conservatively omitted.
VMD0006	The module is applicable for estimating the baseline emissions on forest lands (usually privately or government- owned) that are legally authorized and documented to be converted to non-forest land.	Condition met
VMD0006	Where, pre-project, unsustainable fuelwood collection is occurring within the project boundaries Modules BL-DFW and LK-DFW must be used to determine potential leakage.	Condition met
VMD0009	The module is applicable for estimating the leakage emissions due to activity shifting from forest lands that are legally authorized and documented to be converted to non- forest land, including activity shifting to forested wetlands that are drained or degraded as a consequence of project implementation. The module is also applicable for estimating the leakage emissions due to activity shifting from non-forested wetlands that are legally authorized and documented to be converted and degraded. Under these situations, displacement of baseline activities can be controlled and measured directly by monitoring the baseline deforestation or wetland degradation agents or class of agents.	Condition met
VMD0009	This tool must be used for projects in areas where planned deforestation happens on forested wetlands, regardless of the absence of wetlands within the project boundaries.	Condition met.

VMD0009	The module is mandatory if Module BL-PL has been used to define the baseline, and the applicability conditions in Module BL-PL must be complied with in full.	Condition met
VMD0011	This module is applicable for calculating market-effects leakage from projects that are anticipated to reduce levels of wood harvest substantially and permanently. When project activities result in reductions in wood harvest, it is likely that production could shift to other areas of the country to compensate for the reduction, including activity shifting to forested peatland that is drained as a consequence of project implementation. This tool shall be used in countries where wood harvest happens on forested peatlands regardless of the absence of peatland within the project boundary.	Condition met.
VMD0012	The module is applicable for estimating the leakage emissions due to activity shifting for projects avoiding degradation from fuelwood collection and charcoal production.	Condition met
VMD0013	This module is applicable to REDD project activities with emissions from biomass burning and REDD-WRC project activities with emissions from biomass and/or peat burning. This module is also applicable to RWE and ARR- RWE project activities with emissions from peat burning.	Condition met.
VMD0014	All fossil fuel combustion associated with a project may be accounted for, including fossil fuel combustion of subcontractors that are conducting (parts of the)	Condition met.

	work to implement the project. Fossil fuel combustion in all situations is an optional emission source. Project proponents may, however, elect to include fossil fuel combustion if emissions are higher in the baseline than in the project case thus generating emission reductions through project activities. Where emissions from fossil fuel combustion are estimated in the baseline, monitoring and estimation must also occur in the with-project scenario.	
VMD0015	Strata as defined in the relevant baseline modules are fixed and may not be changed without baseline revision.	Condition met.
VMD0015	The module is mandatory for REDD, CIW-REDD, RWE-REDD and stand-alone CIW project activities.	Condition met.
VMD0016	For peatland rewetting and conservation project activities, this module must be used to delineate non-peat versus peat and to stratify the peat according to peat depth and soil emission characteristics, unless it can be demonstrated that the expected emissions from the soil organic carbon pool or change in the soil organic carbon pool in the project scenario is de minimis	Condition met.
VMD0016	In the case of WRC project activities, the project boundary must be designed such that the negative effects of drainage activities that occur outside the project area on the project GHG benefits are minimized.	Condition met.
VMD0017	This module is mandatory when using the methodology REDD+ MF. It is applicable for estimating the uncertainty of estimates of	Condition met.

	emissions and removals of CO ₂ -e generated from REDD and WRC project activities.	
VMD0017	Where an uncertainty value is not known or cannot be simply calculated, a project must justify that it is using an indisputably conservative number and an uncertainty of 0% may be used for this component.	Condition met.
VMD0017	Guidance on uncertainty – a precision target of a 95% confidence interval half-width equal to or less than 15% of the recorded value must be targeted. This is especially important in terms of project planning for the measurement of carbon stocks; sufficient measurement plots should be included to achieve this precision level across the measured stocks.	Condition met.
VMD0042	This module is applicable to RDP and CUPP activities on project areas that meet the VCS definition for peatland. The scope of this module is limited to domed peatlands in the tropical climate zone.	Condition met.
VMD0042	It must be demonstrated by using the latest version of T-SIG that N ₂ O emissions in the project scenario are not significant, or that N ₂ O emissions will not increase in the project scenario compared to the baseline scenario, and therefore N ₂ O emissions need not be accounted for.	Condition met.
VMD0042	In the baseline scenario, the peatland must be drained or partially drained. At the start of the project, the peatland may still be undrained.	Condition met.
VMD0044	Leakage caused by hydrological connectivity is avoided by project design and site selection, as set out in Section 5 below.	Condition met.

VMD0046	This module is applicable to RDP and CUPP activities as defined in the VCS Standard.	Condition met.
VMD0046	The project area must meet the VCS definition for Peatland. This module is limited to domed peatlands in the tropical climate zone.	Condition met.
VMD0046	It must be demonstrated by using the latest version of T-SIG that N2O emissions in the project scenario are not significant, or that N2O emissions will not increase in the project scenario compared to the baseline scenario, and therefore N2O emissions need not be accounted for.	Condition met.
VMD0046	In the baseline scenario, the peatland must be drained or partially drained. At the start of the project, the peatland may still be undrained.	Condition met.
VMD0046	It must be demonstrated using Module LK-ECO that ecological leakage must not occur.	Condition met.
VMD0054	This module is mandatory for ARR projects and must meet all applicability conditions of VM0047	Condition met.
